

Summary

Minor enhancements and improved functionalities are included as part of this release in certificate search, legacy validation, certificate details, certificate and equipment details tab of certification application and regulator functionalities.

What is new or improved?

1.1. View Certificate

- Auto-loading of certificates is now disabled in View certificates functionality. All certificate results will be displayed only after selecting at least 1 search criteria for the system to display search results. This enhancement will display only the first 500 search items. This is introduced to improve the system's productivity.
- You can now filter and search certificates based on equipment level and certificate status dropdowns.

1.2. Regulator

- **Regulators can now make minor updates to a submitted application** without raising a "Request for Information". The changes made will be visible in the "RFI history" section of the application. This functionality reduces the overall time to assess and make a decision on a submitted application.

1.3. Certificate Details screen

- **"Standards applicable till" is introduced to enable informed decisions during application.** This determines the date of expiry of all the mandatory standards chosen and determines that the certificate cannot be used for equipment registration past this date. If renewing this certificate after this date you will be required to update the mandatory standards and supply test reports for the new standards.
- **"Expected certificate expiry" is introduced.** This will usually be 5 years from the date of application but may be shorter if a regulatory notice has been issued to limit the certification length for the mandatory standards you have chosen. The final expiry date will be set by the regulator at the time of certification and will be listed on the certificate issued.
- The mandatory standards dropdown is now sorted to display grouped standards.

1.4. Equipment details screen

- Bulk edit functionality will display all equipment profiles by default. You can use the search functionality for ease of editing.

1.5. Legacy Validation

- In case of legacy validation during modification or renewal of an application, you can now navigate to different sub-tabs using the "next" button. This feature is introduced to maintain a consistent user experience across the system.

1.6. Certificate

- All issued certificates will now display both the Trade Name and Business Name of your organisation.
